Reasons For Allowance

1. The combination or method as claimed wherein the laser diodes are spaced apart on the array by a distance of between 100 and 1000 micrometers, and a width of emitter surfaces of the laser diodes is less than 10 micrometers (claims 9, 25) or at least one detector for testing for correct functioning and determining a power output of one or of a plurality of the laser diodes (claims 2, 23) or repeating the displacement steps, an amount of the second specific displacement being greater than the spatial interval l of adjacent image points (claim 18) is not disclosed, suggested, or made obvious by the prior art of record.

Maruo et al. (US 5,959,655) discloses an apparatus (Fig. 1) comprising a detector (70) for detecting laser power and controlling beam spot size and shape. However, Mauro et al. does not disclose that the spatial interval between adjacent image points, measured in units of the pitch distance p of the dots, is an integral multiple of the pitch distance between the dots and wherein the integral multiple and the number of image points have no common divisor.
